

Digital Information

8Files for Offset, Laser, Inkjet

Color under Control

With 8Files Digital Information Ltd. presents the ultimate testform for use in the graphics industry. 8Files monitors strengths and weaknesses in the workflow and printing. 8Files is suited to offset, toner, and inkjet print systems.

Color under Control?

Standardizing different printing processes as accurately as possible is of utmost importance. Printing assignments are increasingly distributed to widely-different production facilities, which in turn are exposed to widely-varying technologies. Nowadays every printing house wants to know exactly how stable their equipment performance is, and what sort of deviations can occur. So an optimized testform such as 8Files is indispensable for examining conditions relevant for production.

Everything Included

A testform consist of several elements that are completely different: image data for visualization, technical graphs, test charts for optical and metrological control, and much more. Only when all these components interplay in an 8Files testform can a print properly be judged.

As its name says, 8Files consists of eight data files that can be freely combined. They can – depending on the printing process – be arranged into the required testform, or output individually on small format systems. Hence 8Files covers the entire range of printing systems – from an A4 inkjet printer to a large format offset machine.

8Files is also an ideal tool for adjusting existing printing conditions to international printing standards (e.g. the current ISO version).
